1. INTRODUCTION

1.1. PROJECT OVERVIEW

One of the most important factors which affect our country's economy and financial condition is the credit system governed by the banks. The process of bank credit risk evaluation is recognized at banks across the globe. "As we know credit risk evaluation is very crucial, there is a variety of techniques are used for risk level calculation. In addition, credit risk is one of the main functions of the banking community.

The prediction of credit defaulters is one of the difficult tasks for any bank. But by forecasting the loan defaulters, the banks definitely may reduce their loss by reducing their non-profit assets, so that recovery of approved loans can take place without any loss and it can play as the contributing parameter of the bank statement. This makes the study of this loan approval prediction important. Machine Learning techniques are very crucial and useful in the prediction of these types of data.

We will be using classification algorithms such as Decision tree, Random Forest, KNN, and xgboost. We will train and test the data with these algorithms. From this best model is selected and saved in pkl format. Flask integration and IBM deployment is also be done.

1.2. PURPOSE

- Knowledge of Machine Learning Algorithms.
- Knowledge of Python Language with Machine Learning
- You'll be able to understand the problem to classify if it is a regression or a classification kind of problem.
- You will be able to know how to pre-process/clean the data using different data preprocessing techniques.
- Applying different algorithms according to the dataset and based on visualization.
- Real-time Analysis of Project
- Building ease of User Interface (UI)
- Navigation of ideas towards other projects (creativeness)
- Knowledge of building ML models.
- How to build web applications using the Flask framework.

2. LITERATURE SURVEY

2.1. EXISTING PROBLEM

- Manual cross verification of the credit records and other important data is being tried in the past. It is a time consuming process. A lot of labour is required for this task.
- A lot of capital investment is also involved for the labour. The verification process is also prone to human errors hence lacking in accuracy.
- Low accuracy of manual credibility inspection which leads to misinterpretation of fraudulent loan applicants as credible ones and vice versa.

2.3. PROBLEM STATEMENT DEFINITION

- The prediction of credit defaulters is one of the difficult tasks for any bank.
- Machine Learning techniques are very crucial and useful in the prediction of these types of data. Classification algorithms such as Decision tree, Random forest, KNN, and xgboost can be utilized to serve this purpose.
- A model must be trained using a dataset to predict the credibility of an applicant accurately.

3. IDEATION & PROPOSED SOLUTION

3.1. EMPATHY MAP CANVAS

Smart Lender - Applicant Credibility Prediction for Loan Approval

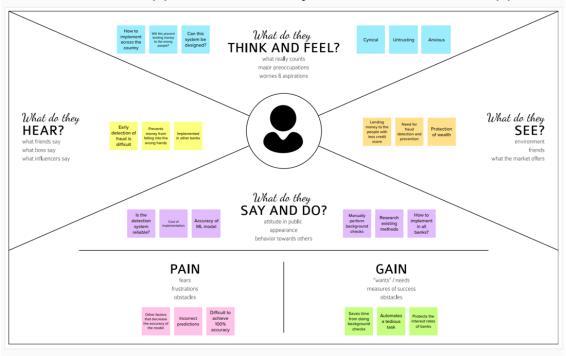

Fig 1. Empathy Map Canvas of our Problem

3.2. IDEATION & BRAINSTORMING

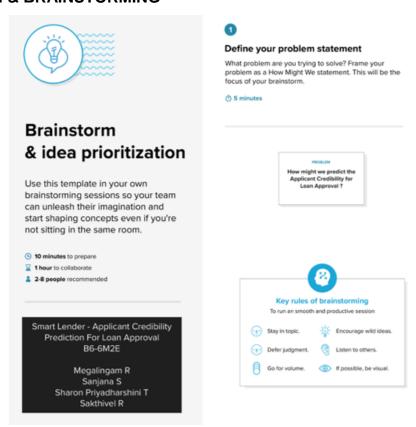

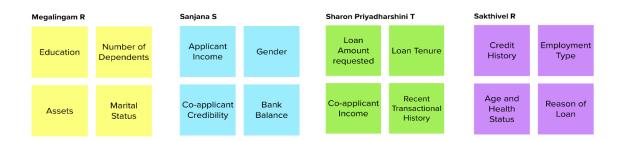

Fig 2. Step-1: Team Gathering, Collaboration and Select the Problem Statement

Brainstorm

Write down any ideas that come to mind that address your problem statement.

10 minutes

Group ideas

Take turns sharing your ideas while clustering similar or related notes as you go. Once all sticky notes have been grouped, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you and break it up into smaller sub-groups.

① 20 minutes

Fig 3. Step-2: Brainstorm, Idea Listing and Grouping

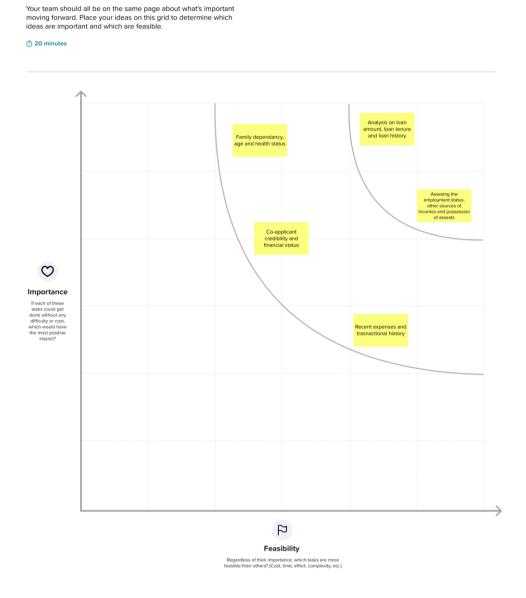

Fig 4. Step-3: Idea Prioritization

3.3. PROPOSED SOLUTION

Prioritize

Table 1. Proposed Solution for the given Problem

| S. No. | Parameter | Description | | | | |
|--------|--|--|--|--|--|--|
| 1. | Problem Statement (Problem to be solved) | The prediction of credit defaulters is one of the difficult tasks for any bank. But by forecasting the loan defaulters, the banks definitely may reduce their loss by reducing their non-profit assets, so that recovery of approved loans can take place without any loss and it can play as the contributing parameter of the bank statement. But manually assessing the credibility of applicants is a time consuming process and incorrect many a times. | | | | |

| 2. | Idea / Solution description | A Machine learning model must be developed to predict the credit defaulters. This model must be trained on previous Loan approval data and their manual credibility checked data. This can be then used to predict the applicant's credibility automatically. |
|----|--|---|
| 3. | Novelty / Uniqueness | In this model, the previous manually checked credibility is taken as training data. Once trained it will take Data on Loan history, Financial status and stability, Family status and Co-applicant Credibility as inputs and will provide a Boolean value output for credibility. |
| 4. | Social Impact / Customer Satisfaction | This model mostly predicts the credibility of a loan applicant accurately, automatically in less time compared to conventional manual checking. This socially helps banks to identify credible loan applicants thus also reduces the loss factor of the Lender (usually Bank). It also speeds up the loan sanctioning process, thus helping the applicants too. |
| 5. | Business Model (Revenue Model) | A model without human intervention reduces capital investment for the man power and it saves time consumed in this manual process. It will also be accurate than the manual credibility checking process, thus preventing money landing on fraudulent hands. |
| 6. | Scalability of the Solution | This model can be used with any number of Loan Applicant data and the same algorithm can be used in all the banks or all lenders. With proper organisation and pre-processing of the data about the loan applicant the above proposed solution is completely scalable. |

3.4. PROBLEM SOLUTION FIT

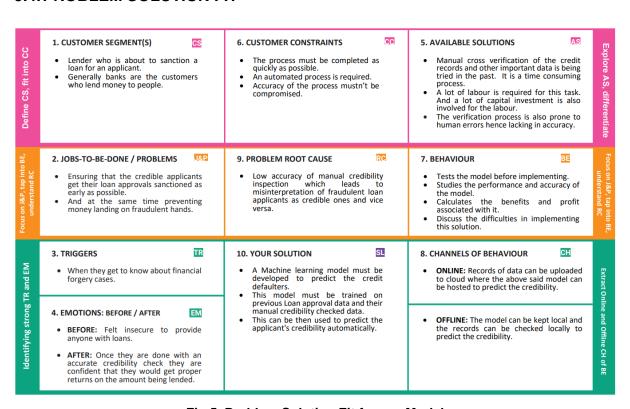

Fig 5. Problem Solution Fit for our Model

4. REQUIREMENT ANALYSIS

4.1. FUNCTIONAL REQUIREMENT

Table 2. Functional Requirement for our Model

| FR No. | Functional Requirement (Epic) | Sub Requirement (Story / Sub-Task) |
|--------|-------------------------------|--|
| FR-1 | User Registration | Registration through Form Registration through Gmail Registration through LinkedIN |
| FR-2 | User Confirmation | Confirmation via Email In-Person Confirmation |
| FR-3 | User Requirements | Knowledge on how to Input Data Basic idea on using a Machine Learning Model |
| FR-4 | User Infrastructure | A system with suitable CPU and GPU to support training and deployment of ML model. |
| FR-5 | Final Result Visualization | Generated results will be visible to the admin through a Web server. |

4.2. NON-FUNCTIONAL REQUIREMENTS

Table 3. Non-Functional Requirement for our Model

| FR No. | Non-Functional Requirement | Description |
|--------|----------------------------|---|
| NFR-1 | Usability | It can be used by all Lenders (i.e., Banks) and can be trained specifically with respect to the Location's Financial Stability. |
| NFR-2 | Security | Storage and Transfer is secure via Encryption Methodologies. |
| NFR-3 | Reliability | The Predicted Credibility is highly reliable than Manual Identification. |
| NFR-4 | Performance | The Performance relies on Input Dataset. |
| NFR-5 | Availability | Can be made available as a Software. |
| NFR-6 | Scalability | Can be scaled for more branches of the same Lender and the dataset can be shared. |

5. PROJECT DESIGN

5.1. DATA FLOW DIAGRAMS

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

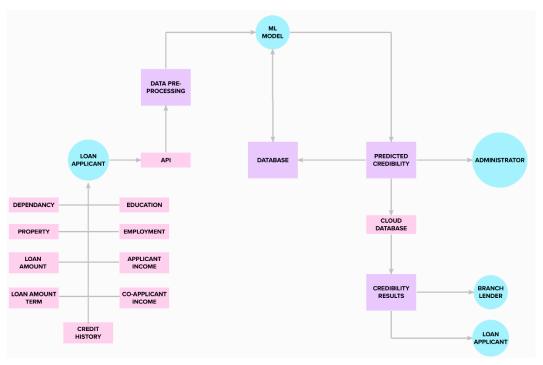

Fig 6. Data Flow diagram of our Proposed Architecture

5.2. SOLUTION & TECHNICAL ARCHITECTURE

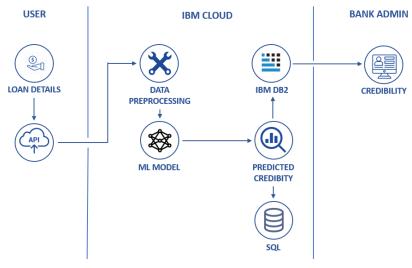

Fig 7. Technical Architecture of our Model

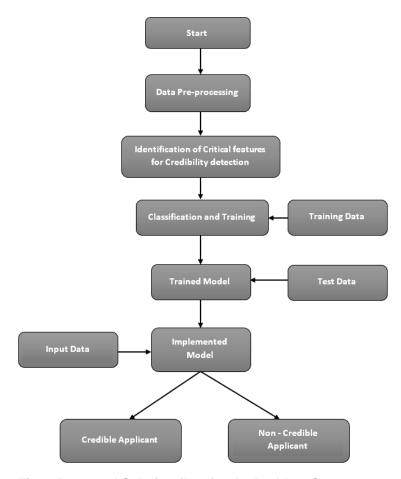

Fig 8. Proposed Solution flow for the Problem Statement

5.3. USER STORIES

Table 4. User Stories and Acceptance Criteria

| User Type | Functional Requirement (Epic) | User Story Number | User Story / Task | Acceptance criteria |
|-------------------------------|-------------------------------------|-------------------------|---|--|
| Customer (Mobile user) | Registration | USN-1 | As a user, I can register for the application by entering my email, password, and confirming my password. | I can access my account / dashboard. |
| | | USN-2 | As a user, I will receive confirmation email once I have registered for the application | I can receive confirmation email & click confirm. |
| | Login | USN-3 | As a user, I can log into the application by entering email & password | I can login to the admin window. |
| | Dashboard | USN-4 | As a user, the credibility results can be checked. | I can visualise the results if details are accurate. |
| Customer (Web user) | Login | USN-5 | As admins, Different Banks and Different branches can have their own admin login and trained model. | Different Admin IDs can be used for different Lender. |
| | Dashboard | USN-6 | As an admin, the credibility result of each loan applicant can be checked. | I can visualise the results if applicant details and database details are accurate. |
| Customer Care Executive | Help Desk | USN-7 | As a Customer Care Executive, I shall attend the calls and guide the user. | I must clearly know the details of the model and the UI. |
| Administrator | Remote Access | USN-8 | I from the main Branch, must have Remote Access to all the Sub-Branches using Cloud. | I manage the data of all the branches and the access must be easy and accurate. |
| | Maintenance | USN-9 | I must be sure that the Servers of all the branches are working in proper condition. | I can check the status of servers. |

6. PROJECT PLANNING & SCHEDULING

6.1. SPRINT PLANNING & ESTIMATION

Table 5. Sprint Planning and Estimation of our Model

| Sprint | Functional | User | User Story / Task | Story | Priority | Team Members |
|-----------|--|--------|---|--------|----------|--|
| Op | Requirement | Story | Coor City / Tuen | Points | | |
| | (Epic) | Number | | | | |
| Sprint-1 | Registration | USN-1 | As a user, I can register for the application by entering my email, password, and confirming my password. | 3 | High | Megalingam R Sanjana S Sharon Priyadharshini T Sakthivel R |
| Sprint-1 | | USN-2 | As a user, I will receive confirmation email once I have registered for the application | 3 | High | Megalingam R Sanjana S Sharon Priyadharshini T Sakthivel R |
| Sprint-1 | | USN-3 | As a user, I can register for the application through Gmail | 2 | Medium | Megalingam R Sanjana S Sharon Priyadharshini T Sakthivel R |
| Sprint-1 | Login | USN-4 | As a user, I can log into the application by entering email & password | 2 | High | Megalingam R Sanjana S Sharon Priyadharshini T Sakthivel R |
| Sprint-1 | Dashboard | USN-5 | As a user, I should be able to access the dashboard with everything I am allowed to use. | 2 | High | Megalingam R Sanjana S Sharon Priyadharshini T Sakthivel R |
| Sprint-2 | Register | USN-6 | As a loan approval officer, I should be able to register myself as one using a unique email and password. | 3 | Medium | Megalingam R Sanjana S Sharon Priyadharshini T Sakthivel R |
| Sprint-2 | Login | USN-7 | As a loan approval officer I should be able to login myself as one using a unique email and password. | 3 | Medium | Megalingam R Sanjana S Sharon Priyadharshini T Sakthivel R |
| Sprint-3 | Automated analysis of credit history | USN-8 | As a loan approval officer, I can access the dashboard where I feed applications for loan prediction. | 2 | Medium | Megalingam R Sanjana S Sharon Priyadharshini T Sakthivel R |

| Sprint | Functional | User | User Story / Task | Story | Priority | Team Members |
|----------|-------------|--------|--|--------|----------|--|
| | Requirement | Story | | Points | | |
| | (Epic) | Number | | | | |
| Sprint-3 | | USN-9 | As a loan approval officer, I can get a decision followed by some details for the decision when I feed an application for loan prediction. | 3 | High | Megalingam R Sanjana S Sharon Priyadharshini T Sakthivel R |
| Sprint-4 | Register | USN-10 | As an admin, I should be able to register myself as one using a unique email and password. | 2 | Medium | Megalingam R Sanjana S Sharon Priyadharshini T Sakthivel R |
| Sprint-4 | Login | USN-11 | As an admin I should be able to login myself as one using a unique email and password. | 2 | Medium | Megalingam R Sanjana S Sharon Priyadharshini T Sakthivel R |
| Sprint-4 | Dashboard | USN-12 | As an admin, I should be able to access the dashboard with everything I am allowed to use. | 2 | Medium | Megalingam R Sanjana S Sharon Priyadharshini T Sakthivel R |

6.2. SPRINT DELIVERY SCHEDULE

Table 6. Sprint Delivery Schedule of our Project

| Sprint | Total Story Points | Duration | Sprint Start Date | Sprint End Date (Planned) | Story Points Completed (as on Planned End Date) | Sprint Release Date (Actual) |
|----------|--------------------------|----------|----------------------|---------------------------------|--|---------------------------------|
| Sprint-1 | 12 | 6 Days | 27 Oct 2022 | 01 Nov 2022 | 12 | 01 Nov 2022 |
| Sprint-2 | 6 | 6 Days | 02 Nov 2022 | 08 Nov 2022 | 6 | 08 Nov 2022 |
| Sprint-3 | 5 | 6 Days | 08 Nov 2022 | 14 Nov 2022 | 5 | 14 Nov 2022 |
| Sprint-4 | 6 | 6 Days | 14 Nov 2022 | 19 Nov 2022 | 6 | 19 Nov 2022 |

Fig 10. Visualising the dataset

This is the Microsoft Excel visualisation of the dataset taken for training the model. It has 11 attributes namely Gender, Married, Dependents, Education, Self Employed, Applicant Income, Coapplicant Income, Loan Amount, Loan Amount Term, Credit History, Property Area. And final result i.e is the loan status is also stored as a column.

Dataset Description

This below function gives the description of the taken dataset. The description includes features of the dataset like count, mean, std, min, etc.,

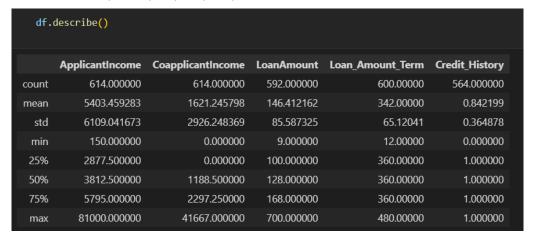

Fig 11.Description of the dataset

Finalising the ML model

The RandomForestClassifier model is fianlised as the model based on the comparision scores and it is trained and exported as pkl file.

```
from sklearn.model_selection import cross_val_score
    rf = RandomForestClassifier()
    rf.fit(x_train,y_train)
    yPred = rf.predict(x_test)
    f1_score(yPred,y_test, average='weighted')
    cv = cross_val_score(rf,x,y,cv=5)
    np.mean(cv)

0.7998331769367115

pickle.dump(rf,open('rdf.pkl','wb'))
```

Fig 26. Exporting the final trained model

7.4. FEATURE 4 - Deploying the model in IBM Cloud

```
Ppip install -U ibm-watson-machine-learning

Requirement already satisfied: ibm-watson-machine-learning in /opt/conda/envs/Python-3.9/lib/python3.9/site-packages (1.0.255)

Collecting ibm-watson-machine-learning

Downloading ibm_watson_machine_learning-1.0.257-py3-none-any.whl (1.8 MB)
```

Fig 27. Installing Necessary Packages

Here the required library of IBM Watson Machine Learning is getting installed.

Fig 28. Authentication and Space Setting

Using the unique API key generated in IBM Cloud and mentioning our server location. Using the API credentials a new space is created in IBM Watson. The space has its unique Space id.

```
In [28]: import sklearn
         sklearn.__version_
  Out[28]: '1.0.2'
In [29]: MODEL_NAME = 'Model_building_SL_223_IBM'
         DEPLOYMENT NAME = 'Smart-Lender 223 IBM'
         DEMO_MODEL = rf

Fig 33. Linking with the model in IBM Cloud

The program in Fig 34. serves as the backend for our Web page API and linking our Machine Learning model with it. We have a home landing page. From that you will be directed to the predict page where you can give the inputs. These input received from that page is then sent to out ML model to do the prediction and the output will be displayed at the next web page. It is the connection between the Frontend and backend.

```
@app.route('/')
 def index():
              return render_template('home.html')
@app.route('/predict')
def predict():
               return render_template('predict.html')
@app.route('/result', methods=['GET', 'POST'])
     ef upload():
                              lend_data = request.form.get('lend')

8.2. USER ACCEPTANCE TESTING

The website has been tested using IBM platform. We had taken inputs from the users who have tested this website and have done modifications to satisfy everones needs. The users found the interface very easy to use. The Web pages were colourful and attractive. There was no unnecessary details in the web page. It was clean and simple that any new user could master it. The data input format was also simple. The user need not enter any unit. He could simply enter the value. The prediction time is fairly low at an average time of 3 seconds. This delay primarily varies depending on the internet connectivity. The model has been hosted in the IBM cloud. Thus with the API available, the model can be accessed remotely from any system provided IBM access key is given. The model predicts the loan status in an more accurate manner. We have two provisions. An applicant can also use this website to predict his loan application acceptance probability. Also a banker/lender can also use this to verify whether the applicant can provided with the loan amount requested. The users are satisfied with the predicted results as they are easier to interrupt. Various inputs have been given by the users to test the consistency of the model. The model proved itself and all the users accepted the model as a reliable and convenient.

9. RESULTS

9.1. PERFORMANCE METRICS

The RandomForestClassifier ML model that we have used here has better performance in speed and accuracy compared to other models. We have compared the performance metrics of 4 models and selected this as the best for the application. The model performed well for all the test cases. The API developed also performed good with no glitches or lag found during the testing phase.

10. ADVANTAGES & DISADVANTAGES

10.1. Advantages

This model is trained based on the previous manually assesed loan applicant's datasets. So it asseses new applications more accurately. It takes a lot of parameters as input for prediction, which makes the model more effective in prediction. Since the dataset is balanced the model trained is also balanced and produce more accurate, unbiased results. The user interface is simple and elegant, hence making it easier for the end user to utilise it. It serves as a boon to both the lender and loan applicant in accessing the loan application. It saves a lot of time and manual labour involved in this process. With this website's prediction values in hand, the applicant can have a confidence in applying for a loan amount. And it is the same in case of the lender, he can confidently lend money to an applicant.

10.2. Disadvantages

This model must extensively reach every person, so that they can make use of this. Massive implementation of this model in all banks might have practical difficulties. Some banks will have some privacy policies which may not allow such implementation in their system. Some banks might need some extra checks before providing loan to a person. In that case they must remodify the model. So as of now this can be a basic gatepass for the lenders to process a loan application.

11. CONCLUSION

The RandomForestClassifier ML model that has been used above performs well for our dataset. The model is fast and consumes less resources. The API developed is also simple and user friendly. By using this model, we could access the credibility of a loan applicant provided the required input data. This saves the time and prevents money landing on fraudulent hands. The model is not 100% accurate but it performs sufficiently well. It can be concluded that the output of this model can be taken as a very important and basic guideline in deciding the credibility of the applicant. Some high priority ground check is unavoidable. So we can proceed to that ground check once we receive a green sign from this model.

12. FUTURE SCOPE

The further works that can be done in this project is to include few more features in model training to study the effect on the prediction. A long history of data (dataset of more than 3 years) can be used for training for increased accuracy. The application can be upgraded such that the input values are fetched directly from the application file and then fed to the model rather than the user entering it manually. A login systems for banks can be developed, so that each bank can have its own login hence making their applicants data more secure.
